New nucleic acid encoding corneal N-acetylglucosamine-6-sulfotransferase, useful for treatment, monitoring and diagnosis of macular corneal The present invention describes human corneal N-acetylglucosamine-6-sulforransferase (I), which is able to catalyse sulfation of keratan sulfate (KS). Also described is a method for monitoring the effect of treatments for macular corneal dystrophy (WCD), and detecting susceptibility to MCD. (I) is located to chromosome 16q22, and has ophthalmological activity. (I) can be used to treat or prevent macular corneal dystrophy types I or II. (I) makes possible treatment of MCD without requiring keratinoplasty or keratectomy. The present sequence represents human intestinal N-acetylglucosamine-6-sulfotransferase, which is given in comparison with (I) in the exemplification of the Example 5; Fig 2A-B; 69pp; English.

Sequence 3, Application US/09927602

Patent No. US20020061562A1

GENERAL INFORMATION:

APPLICANT: Fukuda, Michiko N.

APPLICANT: Arama, Tomoya O.

TITLE OF INVENTION: Methods of Treating Macular Corneal

TITLE OF INVENTION: Dystrophy

FILE REFERENCE: P-LJ 4852

CURRENT APPLICATION NUMBER: US/09/927,602

CURRENT APPLICATION NUMBER: US 09/638,211

PRIOR FILING DATE: 2000-08-19

PRIOR FILING DATE: 2000-08-11

NUMBER OF SEQ ID NOS: 38

SOFTWARE: FastSEQ for Windows Version 4.0

SEQ ID NO 3

LENGTH: 395
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       395

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

N-acetylglucosamine-6-O-sulfotransferase (BC 2.8.2.-) [validated] - human cispecies: Homo sapiens (man) cispecies: Maganana, r.; Matsukawa, T.; Yamakawa, T.; Kurosawa, N.; Biochem. Biochem. Biochem. 274, 291-296, 2000 A; Title: Diversity of N-acetylglucosamine-6-O-sulfotransferases: Molecular cloning of a A; Reference number: JC7350; MUID:20374462; PMID:1091333 A; Residues: 1486 ciUCH. A; Residues: 1486 ciUCH. A; Residues: 1486 ciUCH. A; Residues: 1286 ciUCH. A; Residues: Taks enzyme, having a type II transmembrane topology and N-linked glycosylatic; comment: This enzyme, having a type II transmembrane topology and N-linked glycosylatics sulfate linkage formation. This enzyme is involved in synthesis of L-selectin ligand in C; Keywords: glycolysis; sulfate transport; sulfotransferase; transmembrane protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          3'-phosphoadend

-!- FUNCTION: THES PROTEIN IS A MULTIFUNCTIONAL ENZYME ABLE TO

-- FUNCTION: THES PROTEIN IS A MULTIFUNCTIONAL ENZYME ABLE TO

ACTIVATE AND POLYMERIZE THE AMINO ACIDS LEU, GLU, ASP AND VAL.

ACTIVATION SITES FOR THESE AA CONSIST OF INDIVIDUAL DOMAINS.

-- COFACTOR: CONTAINS 3 COVALENTLY DOUND Phosphopantethelines.

--- PATHWAY: Gyclic peptide antibiotic surfactin biosynthesis.

--- SIMILARITY: Belongs to the ATP-dependent AMP-binding enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                InterPro; IPR006163; Pp_bind.

Res. 4:345-349(1997).
FUNCTION: F-actin-binding protein which may play a role in c Function. Fractin-binding protein which may play a role in c linking actin to other cytoskeletal proteins. Also binds to microtubules (By similarity).
SUBCELLULAR LOCATION: Cytoplasmic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SEQUENCE OF 182-4812 FROM N.A., AND ALTERNATIVE SPLICING. "Chimeric flavonol sulfortansferases define a domain responsible for substrate and position specificities";
J. Biol. Chem. 270:12499-12502(1955).
-!- FUNCTION: Transfers sulfate group into flavonolin position 4'.
May play a role in auxin transport.
-!- STBCELLULAR LOCATION: Cytoplasmic.
-!- TISSUE SPECIFICITY: Highest in shoot tips and lowest in mature leaves and rocts (8y similarity).
-!- SIMILARITY: Belongs to the plant sulfotransferase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100;
